0.1 gsource: Read Data As a Space-Delimited Table

Description

The gsource function allows you to read a space delimited table as a data frame. Unlike scan, you may use gsource in a sourceed file, and unlike read.table, you may use gsource to include a small (or large) data set in a file that also contains other commands.

Usage

```
gsource(var.names = NULL, variables)
```

Arguments

var.names	An optional vector of character strings representing the column names. By default, var.names = NULL.
variables	A single character string representing the data.

Value

The output from gsource is a data frame, which you may save to an object in your workspace.

Examples

```
## Not run:
data <- gsource(variables =  "
                1 2 3 4 5
                6 7 8 9 10
                3 4 5 1 3
                6 7 8 1 9    ")

data <- gsource(var.names = "Vote Age Party", variables = "
                          0    23 Democrat
                          0    27 Democrat
                          1    45 Republican
                          1    65 Democrat               ")
## End(Not run)
```
