0.1 gsource: Read Data As a Space-Delimited Table

Description

The `gsource` function allows you to read a space delimited table as a data frame. Unlike `scan`, you may use `gsource` in a `sourceed` file, and unlike `read.table`, you may use `gsource` to include a small (or large) data set in a file that also contains other commands.

Usage

```
gsource(var.names = NULL, variables)
```

Arguments

`var.names` An optional vector of character strings representing the column names. By default, `var.names = NULL`.

`variables` A single character string representing the data.

Value

The output from `gsource` is a data frame, which you may save to an object in your workspace.

See Also

`read.table`, `scan`

Examples

```
## Not run:
data <- gsource(variables = "
  1 2 3 4 5
  6 7 8 9 10
  3 4 5 1 3
  6 7 8 1 9  ")

data <- gsource(var.names = "Vote Age Party", variables = "
  0    23 Democrat
  0    27 Democrat
```

1 45 Republican

1 65 Democrat ")

End(Not run)
